

ABSTRACT OF THE DISCLOSURE

A mobile lamp includes a first lighting unit for the radiation of a first light beam in a first radiation direction which, for the formation of the first light beam, has at least one first light emitting diode element and one image producing device which is associated with the first light emitting diode element and to which light emitted by the first light emitting diode element can be supplied, and a second lighting unit for the radiation of a second light beam in a second radiation direction differing from the first radiation direction which, for the formation of the second light beam, has at least one second light emitting diode element and one image producing device which is associated with the second light emitting diode element and to which light emitted by the second light emitting diode element can be supplied.
